

CARBON OFFSET
RED DIESEL

Your Greener and Safer Alternative to Red Diesel: CORD

123 Oil supplies CORD from the best sources. The green fuel, CORD, is one of the best solutions for people who are considerate about the climate change crisis and want to save the environment. Carbon Offset Red Diesel is neutral and we have stocked up to be supplied to anywhere across the UK within a short period.

How does Carbon Offset Red Diesel work?

Carbon offsetting is a scheme. A company works to offset its carbon emissions through different activities to enhance the environment. Once done with the carbon emission, the generated emissions are calculated, balancing the environmental initiative. Several activities can be a part of this. Factory renovations and tree planting are two primary examples.

CARBON OFFSET RED DIESEL

The most significant query that clients have from us is whether CORD requires alterations in the engines or not. The answer is simple; NO. Carbon offset red diesel does not demand any modifications in the engine. You don't have to attend to any special arrangements. This is because there is no change in the fuel by itself. Thus no engine changes are required.

Although CORD is a little costly than the regular red diesel, it certainly makes sense as CORD is highly environmentally friendly as well.
